If you look at the reference documentation of Spring MVC controllers, you'll see they have an extended type AbstractHandlerMapping. This one exposes the context of a request in a field, but it's a protected field. So, if you look at the reference documentation you'll see how to get access to the context in order to perform some logic. I don't know what kind of logic you're looking to perform but in any case, it's probably better than inventing your own solution. The effect of free phi80 DNA on the viability and function of the chromosomes in maize. The effect of free phi80 DNA on the viability and function of maize chromosomes (genomes) was assessed. Five lines of inbred maize (Teosinte-GS, Hi-II, MoapaDent, BAC-CI and Sofi) were tested. The lines were treated with various concentrations of phi80 DNA (0, 100, 300, 500, 900 and 1100 ng/g for the leaf, and 0, 1, 3, 5, 7 and 10 microg/g for the seed). To test the sensitivity of maize chromosomes to free phi80 DNA, the inbred lines Hi-II, MoapaDent, and BAC-CI were treated with low concentrations (100 ng phi80 DNA/g for
